

# EARLY STAGE BREAST CANCER

# Epidemiology of breast cancer

# BRAC

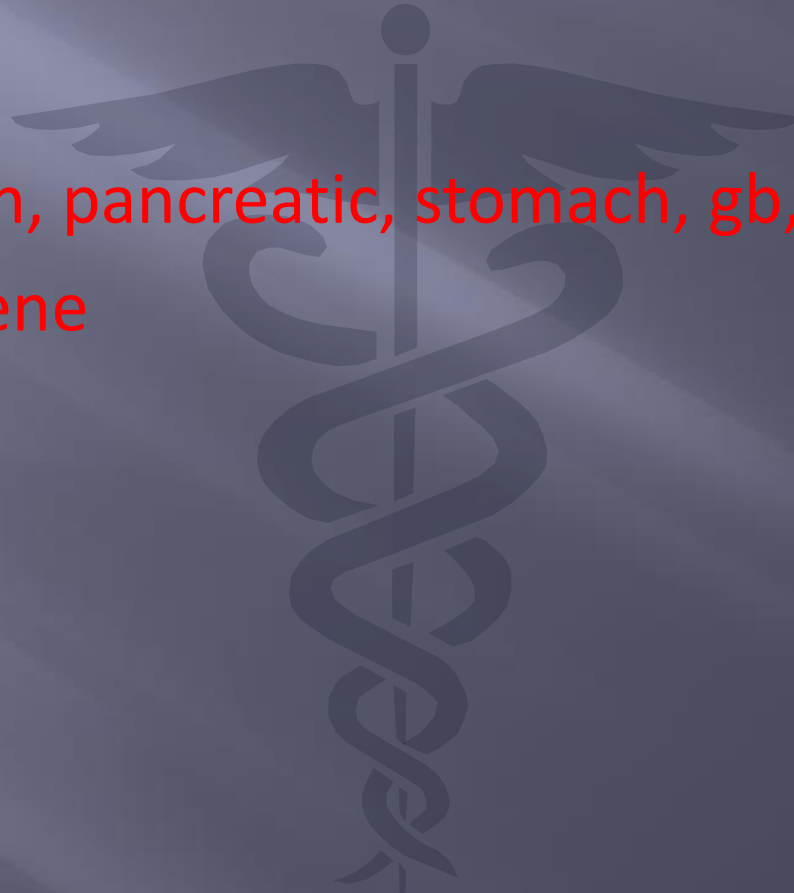

- ▣ 5-10% all breast cancers
- ▣ 10-20% male breast cancers
- ▣ Incidence in the general population is  $\ll 1\%$
- ▣ Incidence in Ashkenazi 2%, 10% if there is a family history
- ▣ 70% risk of breast cancer if BRAC +
- ▣ Risk if PALB2 5-9 fold increase

# BRAC 1

- ▣ Identified in 1990
- ▣ Codes for suppressor gene
- ▣ Chromosome 17
- ▣ More often associated with triple negative disease
- ▣ Increased risk ovarian cancer (20-40 %), pancreatic (5%), less often cervical, uterine, and colon

# BRAC 2

- ▣ Identified on 1997
- ▣ On chromosome 13
- ▣ Increases risk ovarian, pancreatic, stomach, gb, melanoma
- ▣ Tumor suppressor gene

# Screening mammography

# Screening mammography

- ▣ 17-40% reduction in mortality
- ▣ 10% false positives: 8/10 resolved by additional views or U/S
- ▣ One of three biopsies diagnosed with malignancy

# Screening recommendations general population

- ▣ Overall accuracy 78% age over 50 yo 83%
- ▣ ACS rec starting at 45 yo
- ▣ 50-74 yo every two years
- ▣ Greater than 75 yo continue screening for life expectancy  $\geq 10$  years

# HIGH RISK SCREENING

Based on family hx-yearly starting at 40 yo

BRAC-MRI and mammogram yearly

Thoracic radiation-mammograms and MRI starting 8-10 years after RT

# MRI

- ▣ Does not replace mammography
- ▣ Specificity 37-97 %
- ▣ Affected by menstrual cycle
- ▣ False positive as high as 30%
- ▣ Can lead to more aggressive treatment by detecting clinically insignificant synchronous lesions.

# CLINICAL PRESENTATION AND WORK UP

RADIOGRAPHIC

PALPABLE

SECONDARY SIGNS OR SYMPTOMS

# Initial biopsy

# Atypical Ductal Hyperplasia

- ▣ <20 % progress to malignancy if untreated
- ▣ Risk not limited to ipsilateral breast
- ▣ Constitute 3 % of benign breast biopsies
- ▣ Defined pathologically as less than 2 mm or only partially involved duct
- ▣ 20% upgraded on excision
- ▣ Observation an option
- ▣ Endocrine prevention an option

# LCIS

- ▣ Tis
- ▣ 5.3% of insitu lesions
- ▣ Increased risk bilaterally
- ▣ Rarely upgraded (1-5%)
- ▣ Lumpectomy alone vs observation
- ▣ RT not recommended
- ▣ Endocrine therapy controversial

# DCIS

- ▣ Tis
- ▣ 20% of all newly diagnosed “breast cancers”
- ▣ Excision alone-26-36% local recurrence in 13-20 year f/u
- ▣ RT reduces local recurrence by 50% but no change in mortality rate (3%)
- ▣ Endocrine therapy reduces local recurrence by 30% no change in mortality rate
- ▣ Consideration of oncotype scoring

# Prophylactic Endocrine therapy

- ▣ Tamoxifen
  - ▣ 30 % reduction in incidence
  - ▣ No improvement in survival
  - ▣ DVT risk
  - ▣ Uterine cancer risk
  - ▣ Raloxifene-no uterine cancer risk
- ▣ Aromatase inhibitors
  - ▣ 50% decrease in incidence
  - ▣ No improvement in survival
  - ▣ Osteoporosis risk

# **INVASIVE BREAST CANCER**

# NEOADJUVANT CHEMOTHERAPY

- ▣ Large tumors and tumors out of proportion to breast size in patients desiring breast conservation
- ▣ Inflammatory, although not considered early stage independent of nodal status
- ▣ Multiple + LN
- ▣ Stage  $\geq$  III
- ▣ Locally advanced (also not considered early stage)
- ▣ Her 2 neu + tumors  $> 2$  cm

# Indications for mastectomy

- ▣ Multiple tumors in different quadrants
- ▣ Tumor size out of proportion to breast size
- ▣ Inflammatory breast cancer
- ▣ Contraindication to RT
- ▣ Patient choice

# **SURGICAL TECHNIQUES**

# LUMPECTOMY

# Mastectomy incisions

# Nipple sparing mastectomy incision

# BRAC patient treatment options

- ▣ Marked increase in risk to contralateral breast
- ▣ Increased risk second primary in ipsilateral breast
- ▣ Bilateral mastectomy shown to reduce mortality by 50%
- ▣ Oophrectomy strongly recommended

# staging of breast cancer

# ONCOTYPE

- ▣ Typically ordered for ER+ her 2 neu neg LN neg tumors.
- ▣ Recent Taylor X study validated use in 1-3 + LN patients
- ▣ More often decreases the need for chemotherapy in low and intermediate risk groups

# Oncotype for invasive breast cancer

# Oncotype for early stage breast cancer

# ADJUVANT THERAPY

# Radiation therapy

- ▣ Lowers local recurrence rates to approx 5 %
- ▣ Related to margin status-usually “no ink” for invasive and 1 mm for insitu
- ▣ Related to stage and prognostic indicators (ER and her 2 neu)
- ▣ PBI equivalent to WBI

# TAMOXIFEN

- ▣ premenopausal only
- ▣ Nonsteroidal
- ▣ Inhibits binding of estradiol to estrogen receptors
- ▣ Inhibits tumor cell growth
- ▣ May not be quite as effective in ER + but PR – tumors
- ▣ 50% reduction

# Aromatase inhibitors

- ▣ Interferes with the production of estrogens from androgens
- ▣ Limited ability to reduce circulating estrogen (hence not in used premenopausal women)
- ▣ Risk reduction 40-50%
- ▣ Contralateral risk reduction

# Breast Cancer Recurrence Rates by Stage

# Survival rates for Breast Cancer

Stage at Diagnosis	Nodes Involved	Cumulative Risk
T1	0	13%
	1 - 3	20%
	4 - 9	34%
T2	0	19%
	1 - 3	26%
	4 - 9	41%

# SURVEILLANCE

Advanced imaging for signs or symptoms (such as bone pain)

Advanced imaging for abnormal conventional studies (such as CXR)

Routine annual blood work: CBC CMP

Consider tumor markers: ca 15.3 29.27 CEA

Annual 3D mammograms

MRI's based on clinical

DEXA every 2 years for patients on AI

# My own tips

- ▣ Reassurance
- ▣ Precancer terminology for insitu lesions
- ▣ True genetic risk
- ▣ More is not necessarily better
- ▣ Real risk based on current age, not lifetime risk
